

ClauselQ — 5-Minute Client Demo Script

0:00–0:40 — Opening: The Problem

“Imagine your organization has dozens or hundreds of contracts — leases, vendor agreements, NDAs, insurance policies, and supplier terms.

The problem isn't simply storing these documents. The real problem is finding important information quickly, understanding what each contract contains, and making sure important renewal and termination deadlines don't get missed.

That's where ClauselQ comes in.

ClauselQ turns your existing contracts into an AI-powered contract intelligence assistant. Instead of manually searching through documents, you can ask questions in plain English, get answers with their source, see structured summaries, and proactively identify upcoming deadlines and risks.”

0:40–1:30 — Ask a Question: Cited Answer

“Let me start with the most straightforward use case.

I'll ask:

‘What is the monthly rent in the residential lease?’

ClauselQ searches across the contract knowledge base using both semantic and keyword-based retrieval.

And here we get the answer:

‘The monthly rent is \$2,150.00.’

More importantly, ClauselQ tells us where that information came from:

[residential_lease.docx]

This is important in a business setting. The user isn't just receiving an unsupported AI answer — they can see the source contract behind the information.

Here's a tightened version — same structure and timing, but punchier phrasing, less repetition, and reads more like natural speech than written prose:

ClauselQ — 5-Minute Client Demo Script

0:00–0:40 — Opening: The Problem

"Imagine your organization has dozens, maybe hundreds, of contracts — leases, vendor agreements, NDAs, insurance policies, supplier terms. The problem was never storing them. It's finding what you need fast, actually understanding what's in each one, and not missing a renewal or termination deadline.

That's what ClauselQ solves. It turns your contract folder into an AI assistant you can just talk to — ask questions in plain English, get answers with sources, see structured summaries, and get flagged automatically when something needs attention."

0:40–1:30 — Cited Answer

"Let's start simple. I'll ask: *'What's the monthly rent in the residential lease?'*

ClauselQ searches the contract set using both semantic and keyword retrieval, and answers: '\$2,150.00' — sourced directly from [residential_lease.docx].

That citation matters. This isn't an answer you have to take on faith — you can verify it in seconds instead of opening the document and searching yourself."

1:30–2:15 — Structured Summary

"Now, something that happens automatically the moment a contract is ingested: ClauselQ extracts a structured summary — parties, effective date, renewal/termination notice period, payment terms, and a flagged key risk.

This isn't a generated paragraph you have to re-read. It's structured data — real JSON your systems can use downstream. And if a contract doesn't state a field, it stays null instead of the model inventing an answer. That matters — a tool that guesses is worse than one that says 'not specified.'"

2:15–3:20 — Deadline Flagging

"Here's where it stops being just search. Say a vendor agreement has a renewal coming up. I'll ask: *'How urgent is the renewal deadline in the vendor service agreement?'*

ClauseIQ fires a deadline tool that calculates exactly how many days remain and classifies the urgency. Instead of just telling someone *'this renews on this date,'* it tells them it needs action — now.

That's the difference between contract search and contract intelligence: it's not waiting for you to ask the right question, it's telling you what matters."

3:20–4:15 — Follow-Up Action

"Once something's flagged, the next question is always *'what do I do about it?'* ClauseIQ drafts the follow-up email too.

So the whole path — find the contract, understand the clause, catch the deadline, flag the urgency, draft the outreach — happens in one flow. It's not replacing the person who owns the contract. It's getting them to the decision faster."

4:15–5:00 — Close

"In five minutes, we went from a folder of contracts to an assistant that answers with citations, summarizes automatically, catches deadlines, and helps you act on them. Under the hood it's hybrid retrieval, persistent storage, structured extraction, and an agent with memory and tool-calling — but for your team, it's simpler than that: less time searching, fewer missed deadlines, and a contract folder that actually works for you instead of sitting there waiting to be read."

ClauselQ — Sellability

ClauselQ is built for small-to-mid-sized operators who sign a steady stream of contracts but have no dedicated legal or contract-ops function to track them — property managers and landlords (leases), hospitality groups (vendor and SLA agreements), healthcare and dental practices (insurance policies, vendor contracts), and e-commerce operators (supplier terms). The buyer is typically an operations manager, office administrator, or owner-operator, not a general counsel — someone who feels the pain directly but has no systematic way to manage it.

The value isn't "AI that reads contracts" — it's what that unlocks: no more digging through a PDF folder every time someone needs to know what a contract actually says, no more renewal deadlines slipping past unnoticed into an unwanted auto-renewal, and no more unfavorable clauses sitting unnoticed until they cause a real loss. ClauselQ turns a static contract folder into something searchable, structured, and proactive — it tells you what needs attention before you have to ask.

Commercially, this fits a monthly per-seat SaaS model best — a recurring pain point matches a recurring cost, and it's how this buyer already budgets software: roughly \$30–75/user/month, with higher tiers scaling by document volume and adding team features or deeper automation. For a buyer who wants a more hands-on rollout, a one-time setup fee (~\$1,500–5,000, scoped to document volume and any integrations) plus a lighter monthly retainer is a solid alternative — it front-loads the effort of getting their actual contract folder cleaned up and ingested, and opens the door to upselling integrations (e-signature platforms, accounting systems) as retainer add-ons later.
